

NASCENT ENERGY SOLUTIONS

Energy Solutions for the 21st Century

Due to advancements in technology, consumer awareness and recent legislation changes, becoming an environmentally sustainable company has never been so rewarding. Nascent Energy Solutions can work with your company to demonstrate how a custom tailored green initiative can add value to your business without spending a fortune.

NASCENT ENERGY SOLUTIONS- BROCHURE

Company Description

Nascent Energy Solutions provides a series of sustainable energy products to meet the needs of commercial operations (hotels, shopping centers, warehouses, offices) and residential (multi-family or mixed-use) developments. The business is designed to buy, own, and operate renewable energy generating projects; principally involving solar technology and continuing to explore and research other options including wind and geothermal power.

Service for Customers

Our focus is to deliver to customers a renewable energy solution that accomplishes the following objectives:

1. Reduce dependence on high-cost fossil fuel electricity in the long term;
2. Enhance our customer's commitment to create sustainable business operations; and
3. Move customers to the forefront of the green initiative in both the operation of their business and their image as a corporate citizen.

Our Process

Nascent Energy Solutions employs a detailed turnkey process to deliver customized solutions that convert customers into green energy businesses:

1. Perform team site assessment to evaluate a customer's alternative energy technology options;
2. Manage contractors in design and bid preparation to deliver comprehensive proposal options to customer;
3. Work with customer regarding its choice to own systems or be a purchaser of power, explaining the financial and operational considerations of both alternatives
 - In a power purchase agreement (PPA), the energy provider finances, owns, and operates an on-site technology installation which generates green renewable energy that is sold to the customer for a determined rate and period of time;
4. Provide full project design support including architectural, engineering, and other specialty services
 - Where possible we integrate with solar installations the characteristics of sustainable design, including LEED compliance and certification for any remodeling or improvement of existing assets in a redesign project;
5. Build out and test at completion the alternative energy solution; and
6. Develop in conjunction with customer, marketing materials and collateral to reset the public perception as a sustainable green business.

Unique Financial Value

With a primary focus on solar installations, Nascent Energy Solutions has developed an expert understanding of critical financial execution details that deliver value beyond what a traditional solar installer can provide, by evaluating:

1. Options related to state and federal tax credits and grants;
2. Certification and sale of carbon credits;
3. Certification and sale of state renewable energy credits;
4. Energy savings from substitution of solar for existing energy source;
5. Increase in resale value of real estate assets; and
6. Added sales and marketing value of green business image.

Project Execution Value

Because our model is to build, own, and operate solar or other renewable energy installations, we employ only the highest quality and most experienced professional contractors. In a power purchase agreement structure, not only is the access to green energy extremely affordable for customers, the ease of execution is substantial as Nascent Energy Solutions will assume all operating responsibilities:

1. Manage relationship with contractors for client;
2. Provide turnkey conversion of client's energy use model from fossil fuel electricity to sustainable solar power;
3. Monitor and maintain equipment; and
4. Guarantee equipment performance and delivery of renewable energy.
